Creating a Discord Bot

1.Create the Bot on the Server

Go to Discord Developer Portal (set that up if you haven't

Click "New Application" ➜ Give it a name name.

Go to Bot tab ➜ Click "Add Bot".

Under Token, click "Copy" (this is secret — like the PIN...save this in a text file somewhere). Reset the Token if there is no COPY

2. Invite the bot to your server

Make a server first in Discord

In your application, go to **OAuth2 ➜ URL Generator**. (From the Developer Portal for your new Bot)
Under **OAuth2 URL Generator**:

> Scopes: Check bot

> Bot Permissions: Give it permissions like Send Messages, Read Message History, etc. I do Administrator

Copy the generated URL and open it in a new tab to invite the bot to a server you manage. (You need to have made a server already...pretty easy to do. Google it.

3. Write you code:
Pip install discord

Check Git for sample code
